DIPLAY EZ-60 · OPTION 3 TESTERS

Option 3 Probe Guide

DiPlay runs CarPlay on the Mazda EZ-60's screen and windshield HUD. The Option 3 trim seems to have a different HUD from the car it was built on. These steps record what DiPlay sees on your car, so it can be adjusted for Option 3. You then send two text files back.

TIME

About 10 minutes, plus an optional short drive

YOU NEED

The DiPlay EZ-60 APK you were sent, and a phone that can join the car's Wi-Fi hotspot

YOU SEND BACK

Two text files: the diagnostic report and the probe report

Park first. Do the steps on the screen while the car is in P. During the optional drive, only look at the HUD and the road, or let a passenger work the screen.

The pictures come from a test setup. Your car's version text, address and codes will look different.

PART A · PARKED, ABOUT 5 MINUTES

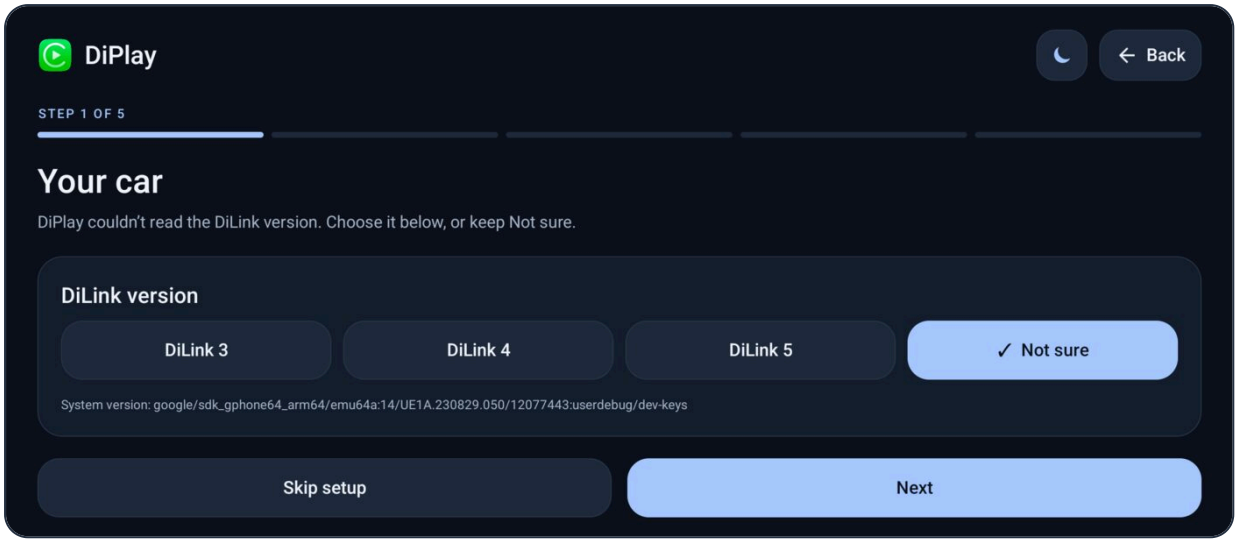

Install DiPlay and run the probe

1 Install the app

Copy the APK to the car, for example with a USB stick and the car's file manager, and install it. It appears in the app list as **DiPlay EZ-60**. If you already have DiPlay EZ-60 from the same source, this installs over it and keeps your settings.

2 Open DiPlay on the driver side

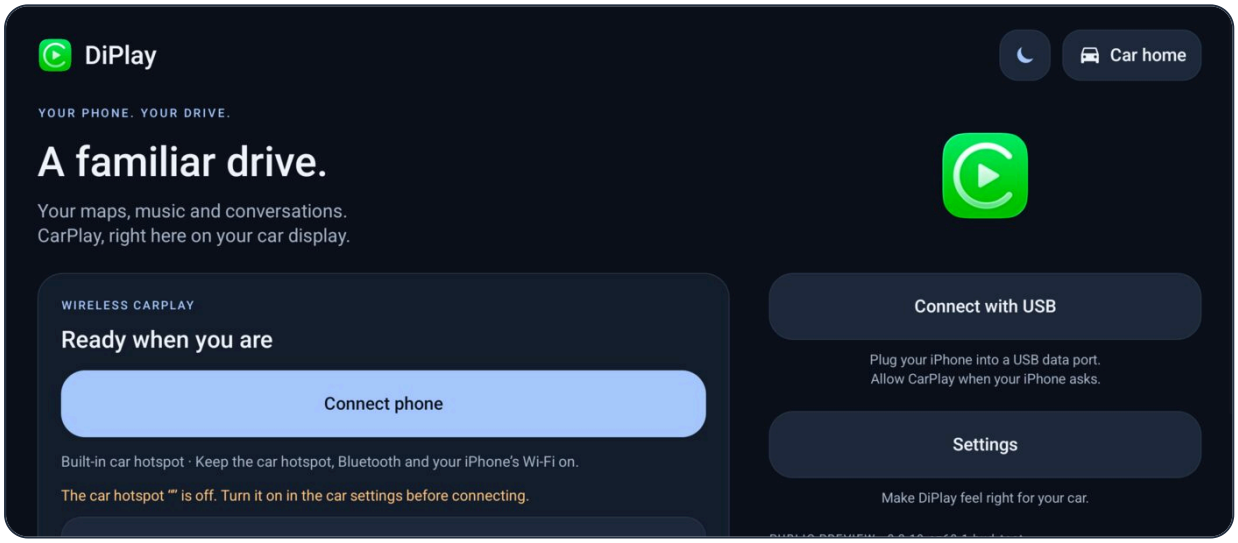

Open **DiPlay EZ-60** from the app list on the driver's half of the screen. The first time, it shows a setup screen. Its DiLink choice does not apply to the EZ-60, so tap **Skip setup**.

First start only. Tap **Skip setup**.

3 Open Settings

On DiPlay's home screen, tap **Settings** on the right.

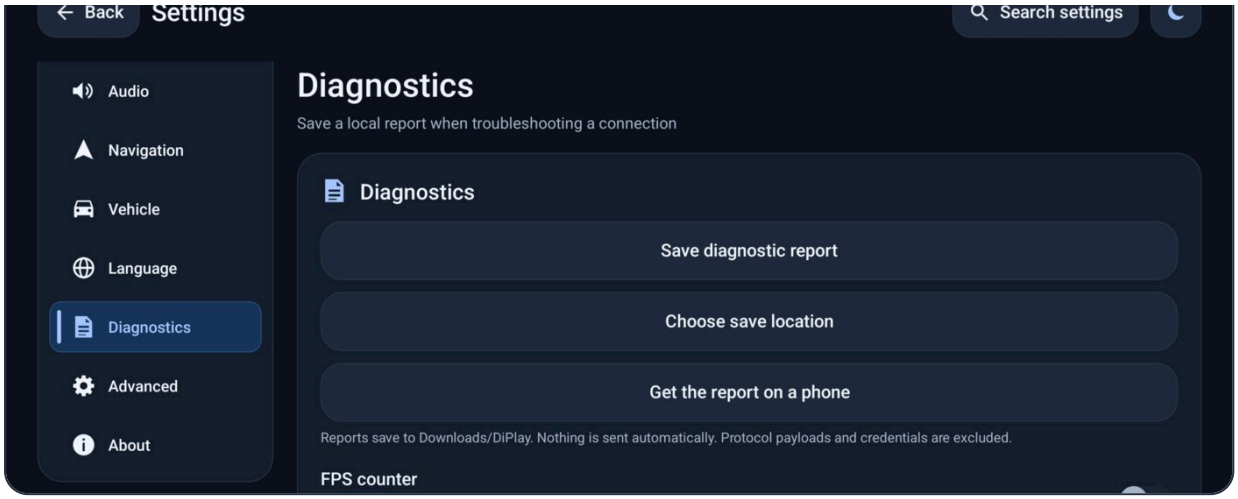

The home screen. A note about the car hotspot may appear under Connect phone; it does not matter for the probe.

4 Go to Diagnostics

In the list on the left, scroll down and tap **Diagnostics**.

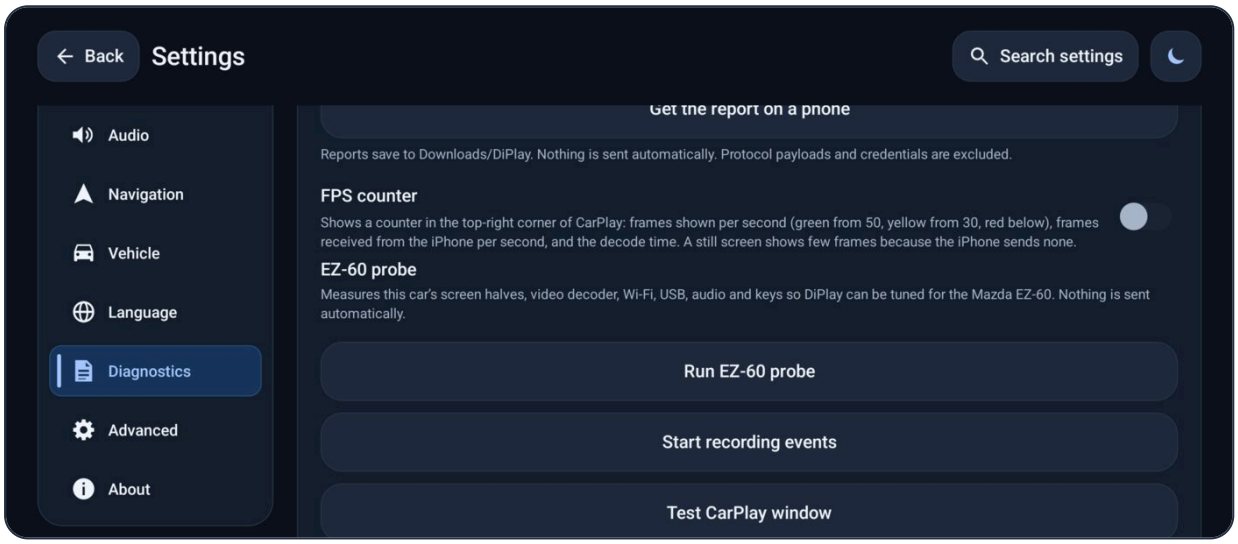

Diagnostics sits between Language and Advanced.

5 Run the probe

Scroll the Diagnostics page down to **EZ-60 probe** and tap **Run EZ-60 probe**. After a few seconds a window opens with the probe report.

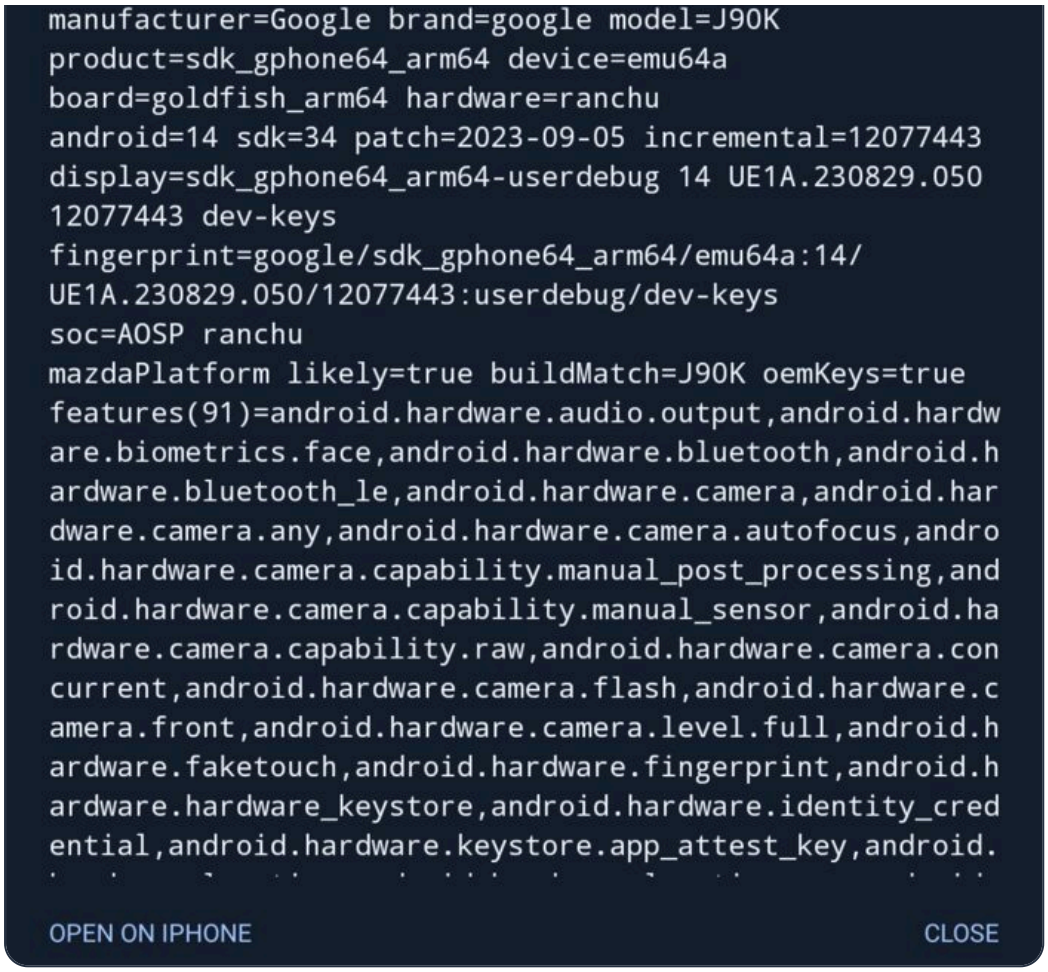

The EZ-60 probe buttons, below the FPS counter.

6 Close the report window

You don't need to read it. Tap **Close** at the bottom right. Leave **Open on iPhone** alone; Part C has an easier way to get the files.

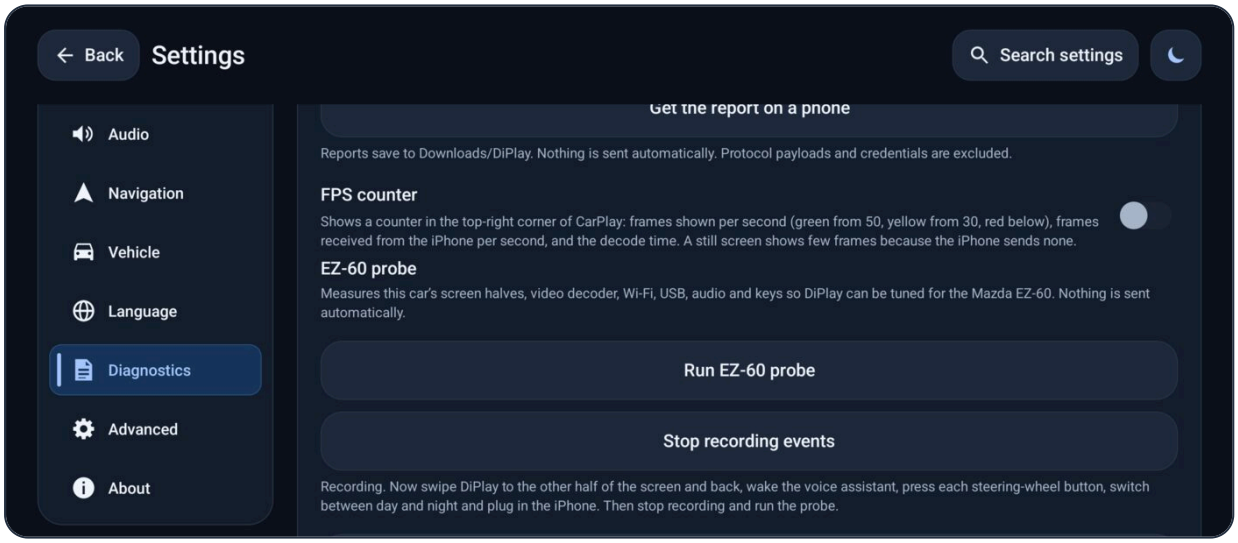

The probe report window.

7 Start recording

Tap **Start recording events**. The button changes to **Stop recording events**. DiPlay now notes what the car does while you use it. Leave it recording and go to Part B, or straight to Part C if you can't drive now.

Recording. The text under the button lists things to try.

PART B · OPTIONAL, 10 TO 20 MINUTES

Use the car normally for a while

8 Try the things the probe watches

- Swipe DiPlay to the passenger half with two fingers, and back.
- Open and close the car's vehicle panel, and wake the voice assistant once.
- Press each steering-wheel button.

9 If you use CarPlay: a short drive with Google Maps

Connect CarPlay with DiPlay as usual, start a route in Google Maps and drive. Watch the HUD:

- Does it show a turn arrow and the distance to the next turn?
- Does the car's own HUD picture (speed, driver assistance) stay as normal?
- Does the dashcam (DVR) or the car show any warning? Note the time.

On your trim, DiPlay sends turn-by-turn to the HUD but no CarPlay map. That is expected.

PART C · PARKED, ABOUT 3 MINUTES

Stop recording and get the files on your phone

10 Stop recording and run the probe once more

Go back to **Settings → Diagnostics**. Tap **Stop recording events**, then **Run EZ-60 probe** again, and **Close** the window.

11 Open the phone page

Near the top of Diagnostics, tap **Get the report on a phone**. The car shows a QR code, an address and a 6-digit code. Keep this screen open until both downloads finish.

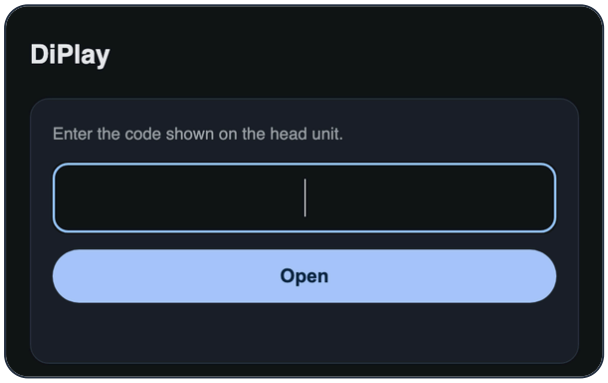

Your QR code, address and 6-digit code will be different. They change each time this screen opens.

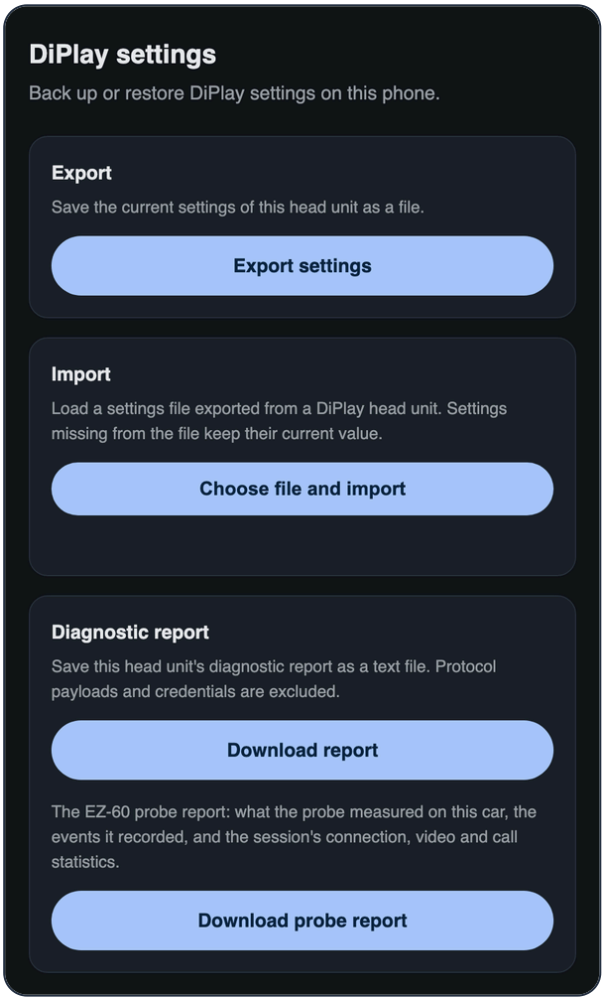

12 Connect your phone

Your phone must be on the same Wi-Fi as the car. The usual way is to join the car's own Wi-Fi hotspot. Then do one of these:

- **Scan** the QR code with the phone camera and open the link.
- **Or type** the address shown on the car (it ends in `:8888`) into Safari or Chrome, enter the 6-digit code and tap **Open**.

If you typed the address: enter the code.

The page you reach, scrolled to the reports

The page you reach, scrolled to the reports.

13 Download both reports

Under **Diagnostic report**, tap **Download report**, then **Download probe report**. Ignore Export and Import. On an iPhone the files go to **Files → Downloads**:

- `diplay-report.txt`
- `DiPlay-EZ60-probe-` followed by the date and time, ending in `.txt`

Send back

- Both text files.
- Your car's trim (Option 3), and whether it has the AR-HUD.
- What the HUD showed, and the time of any dashcam or car warning.

The reports hold DiPlay's logs and your car's technical settings. Passwords, network addresses, serial numbers and the VIN are masked. Open them first if you want to see what you're sending.

IF SOMETHING GOES WRONG

Troubleshooting

The car says it isn't on any network

Turn on the car's Wi-Fi hotspot in the car settings, go back and open Get the report on a phone again.

The phone can't open the page

Check that the phone is on the car's hotspot and not on mobile data only. Type the address exactly as shown, including `:8888`. Keep the car's screen on Get the report on a phone.

The code isn't accepted any more

After five wrong codes the car stops accepting codes. Tap Back, then Get the report on a phone again for a new code.

The page went away after a while

It closes after 10 minutes without use. Open Get the report on a phone again.

DiPlay EZ-60 variant test build, October 2026.
